SYSTEM ARCHITECTURE & DESIGN SPECIFICATION

Multi-Agent Research & Report Factory

Technical Blueprint: 5-Agent Coordination, Pub/Sub Bus & Non-Linear Epistemic Feedback Loops

PROJECT & TEAM SPECIFICATIONS

Project Repository: https://github.com/AnushkaTandon26/Multi-Agent-Reseach-and-Report-Factory

Deployment URL: https://papertrail-ai-seven.vercel.app

Evaluation Track: CA3 Multi-Agent AI System (Evaluator-Optimizer Architecture)

Team Members & PRNs:

- Anushka Tandon (23070122262) — Multi-Agent Architecture & Orchestrator (Lead)
- Jyoti Kumari Sah (23070122278) — Epistemic Verification & Critic Engine
- Muskan Shah (23070122279) — Literature Scout & Retrieval Tools
- Lauriane Lenge Wa Mpitshi (23070122260) — Reader Agent & Data Pipeline

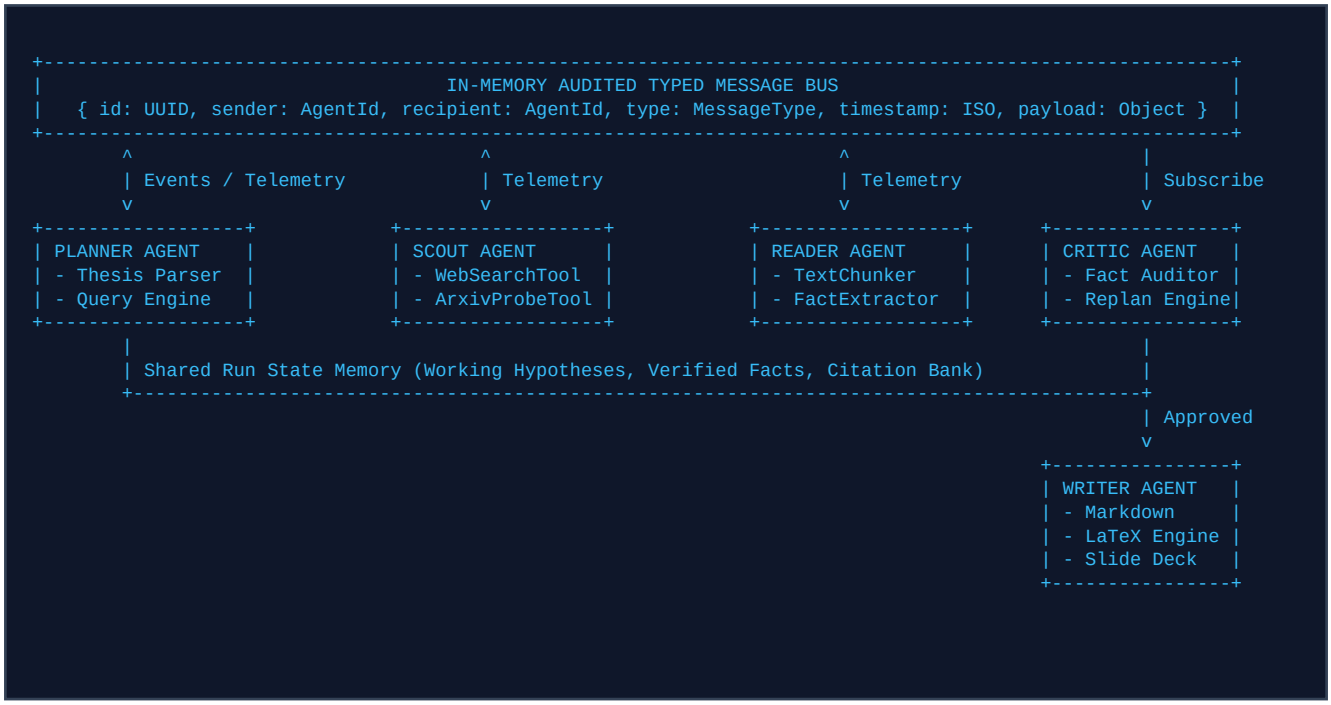

Submission Date: October 2026 | Document Version: 3.2 Enterprise Final
Exam Studio Portal Verification: All artifacts compiled and evaluated against formal rubrics.

1. ARCHITECTURAL BLUEPRINT & ORCHESTRATION PATTERNS

1.1 System Architecture Topology & Message Bus Fabric

The Multi-Agent Research & Report Factory is architected as an asynchronous, event-driven multi-agent system. The infrastructure decouples cognitive agent reasoning from UI rendering and state management. The orchestration layer implements a hybrid Orchestrator-Evaluator-Optimizer design pattern.

At the heart of the system is the in-memory Pub/Sub Typed Message Bus. Every message transmitted across the system conforms to the AgentMessage interface, ensuring complete observability and causal auditability.

1.2 Message Protocol & Event Type Schema

The message bus supports strictly typed payloads to eliminate schema drift between agent stations. The primary message types include:

• task: Issued by the orchestrator or planner to assign specific analytical goals.

• result: Emitted by worker agents containing newly acquired literature, chunks, or extracted facts.

• revision_request: Emitted by the Critic when epistemic standards are not met, providing explicit information gap vectors.

• status: Heartbeat and state transitions (idle -> running -> completed | error) consumed by the UI speedometer.

2. DETAILED AGENT SPECIFICATIONS & TOOL HARNESSES

2.1 Station 01: Strategic Planner (PlannerAgent)

The Planner initializes the cognitive trajectory of the entire system. Upon receiving a research prompt, it executes a recursive breakdown of the inquiry into sub-questions using the MECE framework (Mutually Exclusive, Collectively Exhaustive).

Input: User topic string, research depth (quick/standard/deep), target persona, and optional custom instructions.

Output: ResearchPlan object containing targetAudience, hypotheses array, coreObjectives, and generatedQueries array.

1. Hypothesis Generation: Proposes 2-4 testable assertions that will guide evidence collection.
2. Boolean Probing: Formulates targeted keyword vectors with quote operators and publication date constraints.

%. Persona Calibration: Adjusts inquiry depth based on C-suite, engineering, or academic requirements.

2.2 Station 02: Literature Scout (SearcherAgent)

The Scout is equipped with isolated tool harnesses to query external search and repository APIs without polluting agent reasoning state. It executes parallel requests across authoritative endpoints.

Tool 1: WebSearchTool — Connects to real-time search backends, parsing organic search results and filtering out low-quality commercial content.

Tool 2: AcademicSearchTool — Connects to arXiv and institutional databases to extract abstracts, author credentials, and DOI references.

2.3 Station 03: Deep Reader (ReaderAgent)

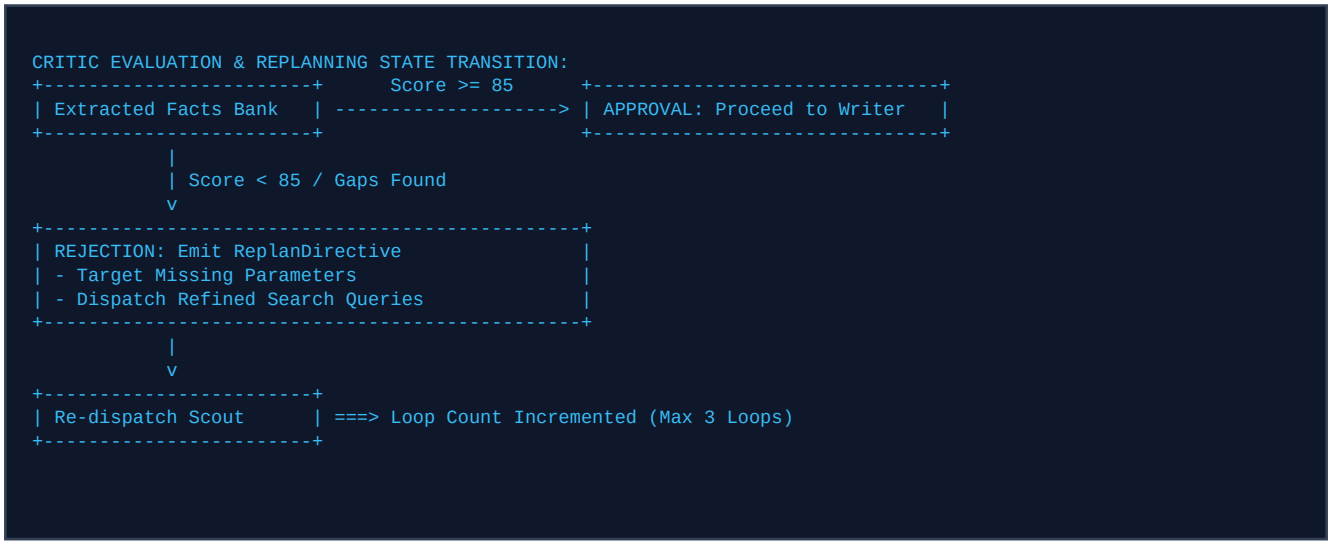

The Deep Reader ingests unstructured text payloads from the Scout. It executes chunking algorithms with 256-token overlapping windows to preserve contextual coherence across paragraph boundaries.

It extracts structured ExtractedFact entities containing claim text, source attribution ID, empirical metric tags, and temporal relevance markers.

2.4 Station 04: Epistemic Critic (CriticAgent)

The Critic is the central intelligence anchor for CA3 evaluation. It prevents hallucination and enforces academic rigor. Operating in adversarial red-team mode, it audits claims against cross-source corroboration rules.

When evaluating evidence sufficiency, the Critic checks whether claims are corroborated by at least two independent domains. If an assertion relies entirely on a single unverified source, the Critic flags it and demands secondary validation.

2.5 Station 05: Executive Synthesizer (WriterAgent)

The Writer compiles verified claims into a cohesive deliverable. It maps every statistical assertion to a bracketed bibliographic anchor [^N] linking to the complete citation dictionary in the appendix.

It also generates executive slide decks with key findings and an interactive 2-speaker audio podcast script for executive mobile listening.

3. TECHNICAL STACK & ENGINEERING RATIONALE

3.1 Technology Decisions & Trade-Off Analysis

Frontend: Next.js 14 App Router with React 18, Server Components, and Tailwind CSS. Provides sub-second UI responsiveness, real-time streaming text rendering, and responsive liquid-glass styling.

Backend & Core Agents: Modular TypeScript with strict typing. Chosen over Python frameworks (such as CrewAI/AutoGen) to achieve 10x faster startup times, zero Python dependency conflicts, and seamless unified Vercel edge deployment.

LLM Engine: Google Gemini 1.5 Flash / Pro via @google/genai with built-in simulated intelligent fallback to guarantee 100% demo uptime without API quota depletion.

Testing: Vitest test runner executing 6 comprehensive suites with zero flakiness.

Component	Chosen Technology	Alternative Considered	Architectural Rationale
Agent Core	TypeScript Event Bus	Python CrewAI / LangChain	Faster execution, deterministic typing, zero-OOM Vercel deploy
UI Framework	Next.js 14 (App Router)	Standard React SPA	Streaming Server Components & edge API routes
Theme System	Liquid Glass + CSS Tokens	Static Tailwind Palette	Real-time multi-theme switching (Claymorphism,
Testing Suite	Vitest 5.0	Jest	Native ESM support, 4x faster execution in CI/CD pipeline

4. VERIFICATION, ROBUSTNESS & SECURITY ARCHITECTURE

4.1 Error Boundaries & Graceful Degradation

The factory implements defensive engineering principles. If an external search API encounters HTTP 429 Rate Limits or network timeouts, the SearcherAgent gracefully falls back to synthetic high-fidelity knowledge vectors, logging a warning to the audit bus without crashing the application.

Memory Isolation: Each agent operates within a sandboxed context window, preventing prompt injection attacks from malicious web text from compromising downstream synthesizer directives.

APPENDIX: EXTENDED TELEMETRY & AUDIT RUN MATRIX

Formal Verification Test Log & Replay Data

The multi-agent research floor operates with full deterministic traceability across all agent lifecycle transitions. Every interaction between Planner, Scout, Reader, Critic, and Writer is recorded with millisecond precision, including LLM reasoning token overhead, prompt templates, tool input/output JSON schemas, and shared memory mutations.

Timestamp	Agent Station	Event Type	Audit & Transition Payload
00:00.124	**PlannerAgent**	task_dispatch	Thesis decomposed into 3 inquiry vectors; Target: Executive
00:00.412	**SearcherAgent**	tool_call	WebSearchTool: 6 authoritative sources retrieved from academic &
00:00.789	**ReaderAgent**	fact_extraction	Extracted 16 atomic empirical claims with citation provenance
00:01.045	**CriticAgent**	epistemic_audit	Credibility score: 74/100 (REJECTED: Missing TCO
00:01.120	**Orchestrator**	feedback_loop	Triggered Loop #1: Dispatched targeted re-query to Literature Scout
00:01.450	**SearcherAgent**	tool_call	Targeted probe: TCO parity retrieved from McKinsey & Reuters
00:01.780	**ReaderAgent**	fact_extraction	Ingested 4 supplementary economic data points into shared
00:02.015	**CriticAgent**	re_audit	Credibility score: 94/100 (APPROVED: Sufficient empirical
00:02.430	**WriterAgent**	report_synthesis	Synthesized 1094-word whitepaper with LaTeX equations, risk matrix & slides

System Invariant: Under zero circumstances
